

Business Security Strategy

A sound Business Security Strategy balances your information security requirements with the objectives of your business — allowing your business to perform in an environment of acceptable risk.

VantagePoint Security's Business Security Strategy services tackle the key components of your security strategy — establishing a solid foundation for securing your valuable information assets and minimizing future information security investments.

Our certified information security specialists will work with you to clearly understand your business objectives and, leveraging their industry experience, develop the following key components of your Business Security Strategy:

- ✓ Security policy
- ✓ Privacy policy
- ✓ Security architecture & standards
- ✓ Security incident response plan

Security Policy

A well-written security policy should align with the guiding principals of your company, reflect the objectives of the business, and serve as a guide for your IT security decisions and investments.

VantagePoint Security™ takes a holistic approach to creating security policy by examining the entire business — critical processes and functions, as well as the staff and technology that provide support. Leveraging internationally respected standards such as ISO17799, our certified information security specialists develop a security policy that meets your business requirements and is reflective of the current best practices in information security.

Whether you have an existing policy that needs to be updated, or are planning your first security policy — the experts at VantagePoint Security can help.

Privacy Policy

The handling and care of customer and employee sensitive information has become a significant social and legal challenge for businesses.

Government regulations such as HIPPA, GLBA, Sarbanes-Oxley Act and the California Online Privacy Act are compelling reasons for companies to update their existing policy or create their first privacy policy.

VantagePoint Security will help you sort through the confusion of these regulations by identifying and defining business processes associated with sensitive personal information, and establish or update your privacy policy to align with current requirements.

Security Architecture and Standards

Security architecture and standards define the basic requirements of your information security infrastructure such as authentication, access control and auditing — providing selection and configuration criteria. A well-defined plan helps guide the future growth of your information security infrastructure and control investment costs.

VantagePoint Security's professional services will assess the current state of your technologies, products and processes, and will create a plan that will grow with your business and leverage your existing information security investments.

Security Incident Response Plan

A security incident response plan is a valuable component of your security strategy. A documented, tested plan that outlines the critical steps your business will take in the likely event of an incident, can drastically reduce the financial impact to your business.

Whether the incident arises because of viruses or worms, employee espionage or sabotage, customer fraud, identity theft, or hacker break-in, every business must be prepared, especially those that depend upon technology to support critical business processes.

VantagePoint Security takes a sensible approach to this problem. Using industry best practices, we build a response framework that aligns with business critical processes and goals, continue with the development of specific security response procedures, and test the plan with one or more simulations.

As businesses and technology change over time, so too must a company's incident response plan. We can periodically examine and update your incident response plan to reflect those changes in order to maximize your business preparedness.

Summary

VantagePoint Security has the expertise and experience to help to build the foundation for a secure environment — one that supports and enables the growth and prosperity of your business, while safeguarding the integrity of your business information.

Next Steps

Our Managed Risk and Awareness Programs provide logical next steps that can improve the overall risk position of your business.
